## Tank Estimators

How can a random sample of integers between 1 and N (with N unknown to the researcher) be used to estimate N?

1.	The tanks are numbered from I to N. Working with your group, randomly select five tanks, without replacement, from the bowl. The tanks are numbered:
2.	Think about how you would use your data to estimate N. (Come up with at least 3 estimators.) Come to a consensus within the group as to how this should be done. One person from your group will report out after the warm-up is over. Ideally, the person to report out will be someone who has not yet spoken in class this semester. Step-up if you haven't yet spoken. Step back if you speak regularly.
	Our estimates of N are:
	Our rules or formulas for the estimators of N based on a sample of n (in your case 5

integers are:

Assuming the random variables are distributed according to a discrete uniform. (Tbh, this model is with replacement, but the answers you get aren't much different than without replacement if  $n \ll N$ .)

$$X_i \sim P(X = x | N) = \frac{1}{N}$$
  $x = 1, 2, ..., N$   $i = 1, 2, ..., n$ 

3. What is the method of moments estimator of N?

4. What is the maximum likelihood estimator of N?

## Mean Squared Error

Most of our estimators are made up of four basic functions of the data: the mean, the median, the min, and the max. Fortunately, we know something about the moments of these functions:

$g(\underline{X})$	$E[g(\underline{X})]$	Var(g(X))
$\overline{X}$	$\frac{N+1}{2}$	$\frac{(N+1)(N-1)}{12n}$
$median(\underline{X}) = M$	$\frac{N+1}{2}$	$\frac{(N-1)^2}{4n}$
$\min(\underline{X})$	$\frac{(N-1)}{n} + 1$	$\left(\frac{N-1}{n}\right)^2$
$\max(\underline{X})$	$N - \frac{(N-1)}{n}$	$\left(\frac{N-1}{n}\right)^2$

Using this information, we can calculate the MSE for 4 of the estimators that we have derived. (Remember that  $MSE = Variance + Bias^2$ .)

MSE 
$$(2 \cdot \overline{X} - 1) = \frac{4(N+1)(N-1)}{12n} + \left(2\left(\frac{N+1}{2}\right) - 1 - N\right)^2$$

$$= \frac{4(N+1)(N-1)}{12n}$$
(1)

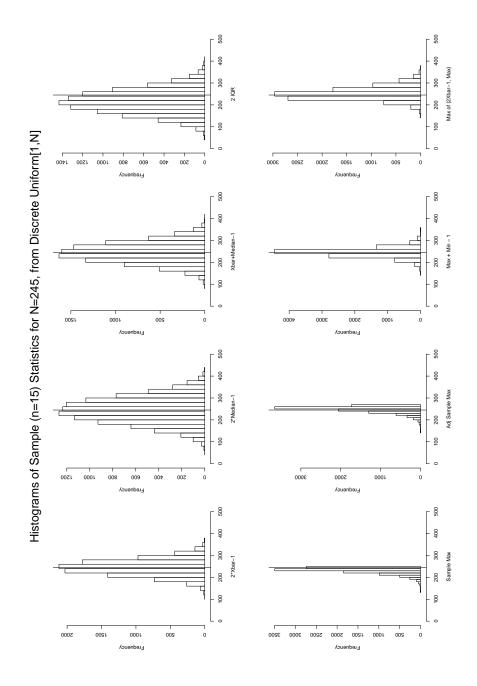

MSE 
$$(2 \cdot M - 1) = \frac{4(N-1)^2}{4n} + \left(2\left(\frac{N+1}{2}\right) - 1 - N\right)^2$$
  
=  $\frac{4(N-1)^2}{4n}$  (2)

MSE 
$$(\max(\underline{X}))$$
 =  $\left(\frac{N-1}{n}\right)^2 + \left(N - \frac{(N-1)}{n} - N\right)^2$   
 =  $\left(\frac{N-1}{n}\right)^2 + \left(\frac{N-1}{n}\right)^2 = 2 * \left(\frac{N-1}{n}\right)^2$  (3)

$$MSE\left(\left(\frac{n+1}{n}\right)\max(\underline{X})\right) = \left(\frac{n+1}{n}\right)^2 \left(\frac{N-1}{n}\right)^2 + \left(\left(\frac{n+1}{n}\right)\left(N - \frac{N-1}{n}\right) - N\right)^2 (4)$$
